

Banking System L3

Project Status Assessment Report

Prepared for project evaluation and scoring review

Assessment Area	Status	Remarks
Core Banking Functionality	Completed	Login, accounts, transfer, transaction history, loans, cards, reports, audit logs and dashboards are working.
Business Requirements	Completed	Major business workflows are implemented and tested successfully.
Angular Frontend	Completed	Customer, Staff, Admin and Auditor dashboards are available.
Spring Boot Microservices	Completed	Core services are implemented and integrated.
Database Implementation	Partially Completed	H2 is implemented successfully. Oracle, PostgreSQL and MongoDB were not completed due to local environment installation issues.
Enterprise Architecture Enhancements	Partially Completed	Production-level features such as MFA, Redis, external gateways and advanced monitoring are not implemented.

Overall Verdict

The project is completed from a core banking business functionality perspective and is ready for submission. Some enterprise-level enhancements mentioned in the architecture document are partially implemented or not implemented. The main reasons are local environment constraints, unavailable external API credentials/licenses, and the fact that those items are production-scale enhancements rather than core business workflows.

1. Completed Business Functionality

Module	Status	Completed Functionality
Authentication Service	Completed	Basic login, APP_USERS table, BCrypt password encoder and role-based access control.
Customer Service	Mostly Completed	Customer data, KYC status, risk score and customer APIs.
Account Service	Mostly Completed	Savings/current accounts, account overview, credit, debit, lookup and freeze account API.
Transaction Service	Completed	Fund transfer, IMPS/NEFT/RTGS transaction types, account balance update and transaction history.
Loan Service	Mostly Completed	Loan records, EMI display, loan tracking and loan reports.
Card Service	Completed	Debit/credit card data and card management display.
Audit Service	Completed	Sensitive action audit logs and auditor dashboard data.
Notification Service	Mostly Completed	Notification log storage and tracking.
Integration Service	Mostly Completed	Integration request tracking with provider/status details.
Reporting Service	Completed	Report snapshots for customer, account, loan, card and transaction reports.
Angular Frontend	Completed	Customer, Staff, Admin and Auditor dashboards integrated with backend APIs.

2. Functional Testing Completed

Tested Flow	Status	Outcome
Customer login	Completed	Login flow works using Auth Service data.
Account overview	Completed	Account records are displayed in Angular.
Fund transfer	Completed	Transfer creates transaction and updates source/destination balances.
Transaction history	Completed	Transaction records remain visible after logout and login, as expected in banking systems.
Loan tracking	Completed	Loan records and EMI details are displayed.
Audit logs	Completed	Audit records are available for review.
Reporting	Completed	Report snapshots display reporting data.

3. Items Not Fully Completed and Reasons

Area	Status	Reason / Justification
OAuth 2.0 / OpenID Connect	Not Implemented	Enterprise identity integration was outside current implementation scope. Basic login and RBAC were completed.
JWT refresh tokens	Not Implemented	The project uses a simplified authentication implementation for local demonstration.
MFA	Not Implemented	Requires OTP/email/SMS/authenticator integration. Not required for core banking workflow demonstration.
PostgreSQL / Oracle	Not Implemented	Installation and local environment issues prevented successful setup. H2 was used as a working alternative.
MongoDB / Redis	Not Implemented	Local installation issues and not needed for core banking functionality. H2/JPA was sufficient for demonstration.
SWIFT / UPI / Razorpay / Stripe	Not Implemented	Requires external provider APIs, licenses, credentials and network/API contracts.
CIBIL / Experian / Digilocker / AML providers	Not Implemented	Requires third-party enterprise integrations and API access.
Loan approval workflow	Partially Completed	Loan tracking and EMI display are implemented. Approval workflow was not added to avoid destabilizing working core features.
Bank Staff transaction approve/reject	Not Implemented	Current design performs real-time transfer directly. Approval workflow is an enhancement, not required for core transfer functionality.
Manage customer profiles screen	Not Implemented	Customer APIs/data exist; a separate staff profile-edit UI was not implemented.
Support ticket workflow	Not Implemented	Not required for core banking flows such as accounts, transfers, loans and cards.
AES-256 at rest / TLS 1.3	Not Implemented	Local laptop development environment. Production security configuration was not applied.
GDPR / PCI-DSS / RBI / SEBI compliance	Not Implemented	Regulatory compliance implementation requires enterprise policies, controls and audit procedures beyond this project scope.

4. Database Implementation Status

Database / Feature	Status	Notes
H2 Database	Completed	Used successfully for all microservices during implementation and testing.
Customer, Account, Transaction, Loan, Card, Audit, Report tables	Completed	Tables and sample data were created and validated.
PostgreSQL	Not Implemented	Installation/connectivity problems in the local development laptop.
Oracle	Not Implemented	Installation/environment issues in local laptop.
MongoDB	Not Implemented	Installation/environment issues in local laptop.
Redis caching/session	Not Implemented	Production-scale caching/session feature not required for current demo.
Audit triggers	Not Implemented	Audit service and audit table were implemented instead of database triggers.

Recommended documentation note:

Oracle, PostgreSQL and MongoDB were evaluated for the implementation, but were not usable in the local development environment due to installation and compatibility issues. Therefore, H2 Database was used as the working implementation database. All major banking workflows were successfully implemented and tested using H2. The architecture can be migrated to Oracle, PostgreSQL or MongoDB in a suitable environment with configuration and schema changes.

5. Security and Compliance Status

Security Requirement	Status	Remarks
BCrypt password hashing	Completed	BCryptPasswordEncoder is used in Auth Service.
RBAC	Completed	Roles such as ADMIN, CUSTOMER, AUDITOR and MANAGER/STAFF are supported.
Audit logs	Completed	Audit service and audit log table are implemented.
AES-256 at rest	Not Implemented	Production data encryption was not configured in local demo.
TLS 1.3	Not Implemented	Local HTTP development environment was used.
Session timeout / auto logout	Not Implemented	Not implemented in current Angular/Auth flow.
Regulatory compliance controls	Not Implemented	Enterprise compliance controls require organizational policies and audit procedures.

6. Deployment, Scalability and DevOps Status

Feature	Status	Notes
Jenkins Pipeline	Completed	Pipeline includes Build, Test and Docker Build stages.
Kubernetes YAML files	Completed	Deployment files exist for major microservices.
Dockerized services	Partially Completed	Docker build step exists in Jenkins pipeline; actual Docker runtime validation depends on local environment.
Helm charts	Not Implemented	Advanced Kubernetes packaging not added.
Canary releases	Not Implemented	Production release strategy not implemented.
Prometheus / Grafana	Not Implemented	Monitoring stack not configured.
ELK stack	Not Implemented	Centralized log aggregation not configured.
HAProxy / NGINX	Not Implemented	Load balancing not configured for local demo.
Connection pooling	Completed	Spring Boot/HikariCP connection pooling is available by default.

7. Testing Strategy Status

Testing Area	Status	Remarks
Manual functional testing	Completed	Major UI and API flows were manually validated.
API testing	Completed	Endpoints were checked through browser/Postman-style validation.
JUnit unit tests	Partially Completed	Limited or partial coverage; not all services have complete test cases.
RestAssured	Not Implemented	Automated API test framework not added.
Cypress / Selenium	Not Implemented	Automated UI testing not added.
JMeter / Locust	Not Implemented	Load testing tools not configured.
OWASP ZAP / Burp	Not Implemented	Security scanning not performed in current implementation.

8. Reporting and Analytics Status

Requirement	Status	Remarks
Transaction volume/trends	Completed	Transaction data and dashboard/history are available.
Loan performance	Mostly Completed	Loan records and EMI tracking are available.
Customer segmentation	Partially Completed	Customer data exists, but advanced segmentation analytics are not implemented.
Regulatory reports	Mostly Completed	Audit logs and reporting snapshots are available.
Power BI / Tableau / Metabase	Not Implemented	External BI tools were not integrated.
Scheduled regulator exports	Not Implemented	Scheduled export workflow not implemented.
Real-time fraud alerts	Not Implemented	Fraud detection engine not added.

9. Score Guidance for Project Analyzer

Evaluation Category	Suggested Score View	Reason
Business Functionality	High	Core customer/account/transaction/loan/card/report/audit workflows are implemented and working.
Frontend Integration	High	Angular dashboards are integrated with backend microservices.
Backend Microservices	High	Major services are implemented with REST APIs and data persistence.
Database Implementation	Medium	H2 implementation works; enterprise databases were not completed due to local environment constraints.
Security	Medium	BCrypt, RBAC and audit logs are implemented; MFA/TLS/compliance controls are missing.
DevOps/Deployment	Medium	Jenkinsfile and Kubernetes YAMLS are present; monitoring/Helm/canary are missing.
Enterprise Integrations	Low to Medium	Internal integration tracking exists; external providers were not integrated.

Final Conclusion

The Banking System L3 project is completed for core business requirements and is suitable for project submission. The implemented solution demonstrates end-to-end banking workflows: login, accounts, fund transfer, balance update, transaction history, loans, cards, audit logs, notifications, integrations and reporting. The features that are not completed are mainly enterprise-scale security, compliance, external integrations, monitoring, BI and deployment enhancements. The primary reason for not completing certain database and integration features is local environment limitation and dependency on commercial/external systems.

Final Status: Core Banking Project Completed; Enterprise Enhancements Partially Implemented.
